Detailed Action

The instant application having Application No. 10/530,375 has a total of 16 claims pending in the application, there are 2 independent claim and 14 dependent claims, all of which are ready for examination by the examiner. Claims 15-16 and 20 were cancelled by the amendment dated 4/9/2009. Claim 14 was cancelled by the examiner's amendment below.

EXAMINER'S AMENDMENT

1. An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it MUST be submitted no later than the payment of the issue fee.
2. Authorization for this examiner's amendment provided below was given in a telephone interview with Dicran Halajian on 9/21/2009.

The claims read as follows:

1. (Currently Amended) A data processing apparatus, the apparatus comprising: an instruction addressing unit; an instruction memory system arranged to output an instruction word, ~~capable of~~ containing a plurality of instructions, in response to an instruction address from the instruction addressing unit, the instruction memory system comprising a plurality of memory units, arranged to output respective parts of the instruction word in parallel; an instruction execution unit, comprising a plurality of

functional units, each capable of executing a respective instruction from the instruction word in parallel with execution of other instructions from the instruction word by other ones of the functional units; an instruction address modification circuit arranged to modify translation of the instruction address into a physical address for a particular one of the memory units relative to other ones of the memory units and to change generation of instruction words from instructions from different memory units during execution of a program, the instruction address modification circuit being configured to modify an address translation between supplying a first instruction address for a first instruction word and supplying a second instruction address for a second instruction word, the second instruction word being different from the first instruction word and including a copy of a part of the first instruction word, so that the part of the first instruction word is re-used in the second instruction word thereby reducing memory needed to store the program, wherein the instruction address modification circuit includes an offset register which is directly connected to an output of a functional unit of the plurality of functional units, the functional unit updating an offset value in the offset register during the execution of the program, and wherein the instruction address modification circuit is operationally coupled to a controller that provides the instruction address, and to one of the plurality of the functional units that provides an adjust signal to the instruction address modification circuit, and wherein the controller is distinct from the functional unit; the instruction address modification circuit being configured to modify the translation in response to the adjust signal and to provide a modified translated address to one of the plurality of the memory units.

11. (Currently Amended) A method of executing a program of instruction words with a data processing apparatus that comprises a plurality of functional units ~~capable of executing that execute~~ a plurality of instructions from each instruction word in parallel, wherein the instructions from each of at least some of the instruction words are fetched from respective memory units in parallel, the method comprising the acts of: addressing the instruction word with an instruction address that is common for the functional units, using a modifiable translation of the instruction address into a physical address for a particular one of the memory units to select dependent on program execution which instructions from the memory units will be combined into the instruction word in response to the instruction address; modifying an address translation between supplying a first instruction address for a first instruction word and supplying a second instruction address for a second instruction word, the second instruction word being different from the first instruction word and including a copy of a part of the first instruction word, so that a part of the first instruction word is re-used in the second instruction word thereby reducing memory needed to store the program; and connecting an output of an offset register to an offset adder, the offset adder being connected between a controller that provides the instruction address and the particular one of the memory units; wherein the modifying act includes updating, by a functional unit of the plurality of functional units, an offset value in the offset register during the execution of the program, the offset register being directly connected to an output of the functional unit, and the controller being distinct from the functional unit.

14. (Cancelled)

Reasons for Allowance

3. The reasons for allowance can be found below:

The following is an examiner's statement of reasons for allowance:

4. **Claim 1** recites the limitation of "where the instruction address modification circuit includes an offset register which is directly connected to an output of a functional unit of the plurality of functional units, the functional unit updating an offset value in the offset register during the execution of the program ... and wherein the controller is distinct from the functional unit." This limitation is taught in the specification, page 4, lines 13-28 and shown in fig. 1. This limitation in combination with other recited limitations of claim 1 is not taught or suggested by the prior art of record. Claim 11 recites a similar limitation.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
